# Matrix42 Patch Management

MATRIX42

Keep systems up-to-date and secure, and free up IT resources with automated patch management!

As software applications become more sophisticated and complex, the likelihood of coding mishaps or unexpected interactions of code that create vulnerabilities or impact the performance of the application has greatly increased. The number of patches that need to be delivered regularly to an increasingly mobile workforce that connects from multiple locations and with multiple devices can keep IT departments bogged down in mundane and tedious tasks. At the same time, the process cannot be ignored or delayed because it exposes the company to malicious attacks that can compromise sensitive information and waste company resources.

Patching made easy.

Matrix42 Patch Management automates the process of keeping systems up-to-date, running efficiently and more secure by ensuring they have the latest patches installed. It provides centralized patch management for Windows systems and commonly used applications from 30 additional vendors.

Administrators can set up Matrix42 Patch Management to continuously scan and deploy all available patches for workstations and physical and virtual servers. Patch updates can also be prioritized so critical security patches are deployed right away and others can be scheduled for delivery and/or installation outside business hours or during non-peak times.

IT administrators have much better things to do than to spend the bulk of their time deploying patches and updates. With automated patch management, companies maintain the security of their systems by closing up known vulnerabilities and free up their IT resources to devote to more strategic business initiatives.

Product Features

- **Support for all patches from Microsoft and 30 additional vendors** for operating systems and applications. Covers 2,000 products and 74,000 patches.

- **Scanning by groups** such as domain, organizational unit and machine name.

- **Scheduled distribution tasks** to apply patches to individual computers or roles.

- **Scheduled patch execution** on each system for a specific date/time or immediately.

- **Email notifications** of newly available patches and products or when new definition is downloaded.

- **Display all installed patches** on the client, whether they're installed by Matrix42 Patch Management or some other way.

- **Scan reports** for network administrators or executives to show results and vulnerabilities.

- **Automatic filtering** to exclude older, obsolete patches and speed up the time to a fully patched state.

- **Agent-based** service.

- **Fully integrated with Matrix42 Workplace Management.**
